

## Can a Biomarker in the Blood Predict Head Fracture After Traumatic Brain Injury?

Written by Business News

---

In cases of traumatic brain injury (TBI), predicting the likelihood of a cranial lesion and determining the need for head computed tomography (CT) can be aided by measuring markers of bone injury in the blood. The results of a new study comparing the usefulness of two biomarkers released into the blood following a TBI are presented in *Journal of Neurotrauma*, a peer-reviewed journal from Mary Ann Liebert, Inc., publishers. The article is available free on the *Journal of Neurotrauma* website until January 11, 2015.
