

After a stroke, poor information increases risk of depression

Written by Business News

People recovering from a stroke and living at home have generally a higher risk of suffering from depression. According to researchers lack of information is often a major concern for patients and this frequently contributes to their depression. This is the result of a new study from health sociologists of the University of Luxembourg. Depression can worsen existing problems like reduced mobility or damaged mental faculties and harm a patient's capability to recover.
