

## Researchers at the UJI patent a natural ventilation system of roofs that prevents heat build-up

Written by Business News

---

Researchers at the Universitat Jaume I of Castellón have developed a modular ventilation system for pitched roofs that solves the problem of heat accumulation by solar radiation under the roofs without the need for refrigeration. The patented system by the UJI is a passive and energy efficient solution for thermal conditioning of buildings. The module can be applied to restoration and rehabilitation of roofs, especially to those of historical value, and to new premises.
