

The growing safety concern of pedestrians is increasing with fear of public attacks. While most areas might be safe, people should stay alert when they are in public spaces. According to the Center for Disease Control and Prevention (CDC) research, 430 pedestrians are treated each day for traffic-related injuries.

The government and different organizations can take many steps to enhance the safety of pedestrians. Here are some ways that can be implemented to ensure safety measures.

Install Safety Barriers:

There are many kinds of safety barriers that can be used for pedestrians. For example, there are safety barriers for factories and warehouses to protect the workers from heavy machines. You can install temporary or permanent barriers according to the place.

In places where heavy traffic is in close contact with pedestrians, permanent safety solutions are made. They are designed in a way that compliments the area where it is placed. Steel railings can be installed into concrete to provide safety for pedestrians. For events like marathon races, public concerts, temporary safety barriers are used.

Security Bollards:

Bollards contain a short message and are installed in public for safety purposes. They are installed in concrete or cement to prevent any vehicle from entering the restricted place. Safety bollards can be made to be removable and collapsible. You can also get retractable bollards to lift or lower the sign as needed.

Their primary purpose is to close off a space to provide security from traffic and security threats. Here are some types of safety bollards that can be used to protect pedestrians.

Lighted Bollards:

They are useful in places where pedestrians are common during the nighttime. Drivers usually enter the pedestrian's space during the night, which can lead to an accident. Lighted [bollards in Sydney](#) are used to remind the drivers to drive safely. It also contributes towards eliminating any crime like robbery during the night.

Retractable Bollards:

They are useful for places that require changing the location from pedestrian to non-pedestrian use. If an area needs to retract bollards daily, then automatic ones are the best for use. With the help of a remote control button, their size can be changed.

Decorative Bollards:

They can be used in places where traffic control is more needed. You can customize them according to your building as they do not require to be designed with an impact in mind. They can be used for directing outdoor space usage.

Security Guards and Police Officers:

Other than boards and signs, the human security force is more efficient in implementing safety

control for the public. Security guards are needed, especially in places where a large audience is expected. Even in typical situations, their presence increases the confidence when a customer enters a market.

Police officers are best when it comes to providing heightened security needs. When a uniformed police officer is present, it indicates that the place's safety is taken seriously. They are a direct source of security for the public and are always ready for any emergencies.
