

UBIN AG Announces MiKey to Provide Enhanced Biometric Security to the Enterprise

Written by Australian Business

BERLIN, March 5, 2014 /PRNewswire-iReach/ -- UBIN, AG, a leading provider of biometric security solutions, today announces a new level of Enterprise security with the introduction of the MiKey.

UBIN's MiKey links a user's digital ID to their physical ID and prevents unauthorized access to user accounts and access to private information by integrating a robust fingerprint reader, encryption, storage and Smart Card in a single and simple to use USB Stick form-factor. Augmenting its extremely high security is MiKey's engineered ability to keep the biometrics locked inside the device making extraction impossible. The MiKey has a wide range of applications including: Mobile Device Authentication, PC Login, Secure Cloud Access, Digital Signatures for e-mail, documents and online transactions, Secure Data Storage and Encryption as well as Facility Access. The MiKey solution will offer a new level of secure access for enterprise customers by adding biometric authentication and eliminating the need for passwords and seamlessly integrating into existing infrastructure. The inclusion of wireless NFC (Near Field Communication) capability later in the year will also expand the MiKey application beyond the desktop to tablets and mobile phones thus enabling enhanced security to wherever the user needs to be.

"The MiKey solution is a great leap forward in information security and comes at a relevant time of increasing privacy concerns," said Uwe Braun, UBIN's Managing Director "By combining biometrics, encryption and storage in one highly integrated device, Enterprise customers are able to achieve an unprecedented degree of secure access to their data."

The MiKey will come in a variety of data storage capacities up to 32GB and will be available in the second quarter.

About UBIN AG

UBIN AG is an innovative company that develops high-tech, state of the art IT Security solutions using biometry. UBIN's products bring new dimensions in the biometric world for secure access to data rooms, networks and cloud computing. They make sure that only authorized personnel can gain access to sensitive data. The combination of the independently operating biometric key "MiKey" and the software-based verification and control platform "TENDERTRUST" fully guarantee the identity of that particular personnel.
