) Solon, OH – With a new digital panoramic X-ray machine, comprehensive exams, and in some cases diagnostic models, Solon dentist, Dr. Michael Salkovitch, can create a precise treatment plan for many dental conditions.

[Michael D. Salkovitch, DDS](#) , recently invested in a digital panoramic X-ray machine for his Solon, Ohio dental practice. Unlike traditional film x-rays, digital images take mere seconds to process. According to Dr. Salkovitch, "The machine provides us with digital, panoramic and bite-wing images of a patient's mouth instantly. From there, we can immediately begin diagnosis as well as share our findings with patients on a chair-side computer monitor. In some cases it can help me with patient education just as much as treatment planning."

In addition to providing instant digital x-rays, the new digital panoramic X-ray system eliminates the need to place anything in a patient's mouth during the x-ray process. "Patients love it," Dr. Salkovitch said. "Digital X-rays are often more comfortable for the patient and uses less radiation than traditional dental X-rays."

In addition to all of the benefits for patients, the digital technology makes treatment planning easier for Dr. Salkovitch. "The views of crucial mouth structures are much clearer, allowing me to better diagnose the patient's condition as well as create a tailored treatment plan," Dr. Salkovitch said. "Improvements in treatment planning can save patients money or discomfort down the road as a result."

With a panoramic digital image, dentists can get a better picture of the entire mouth. This includes both the upper and lower jawbones, temporomandibular joints, the mandibular nerve, and teeth. The technology provides a big-picture view of conditions in the mouth and sometimes aids in finding problem areas sooner than taking a single X-ray of a single area of the mouth.

Dr. Salkovitch explained that panoramic digital imaging is also helpful for patients with special needs, restless children, and fearful adults and people with sensitive gag reflex. The equipment

is easy to set up and use, which helps to alleviate fear. Auto-focusing and other features ensure a crisp image so patients can get the best treatment possible.
