

ANYANG-SI, SOUTH KOREA, September 17, 2013 /**24-7PressRelease**/ -- SENTENCE CO., Ltd, a company specializing in Cloud services has released a Cloud clipboard service called 'Clippick 2.0' which provides data transmission from PC to Smart devices. The most significant feature of the new version is its 7 to 10 times faster data transmission speed which makes it possible to transmit data in real time.

Since the popularization of smart devices, there have been rising needs for transmitting content from PC to Smartphone and vice versa. The Clippick service was created based on these new needs. Users can start using the service by installing Clippick application on their PC and downloading it to their smartphones.

It is especially impressive that in Clippick users can use shortcut keys on their PC. URL addresses, images, websites etc. can be automatically saved by dragging the desired area and pushing 'Ctrl + C'. The saved content is directly synchronized on the Clippick application in smartphones. Users can then paste the content to Kakao talk or email on their smartphones without having to open Clippick.

SENTENCE CO.,Ltd explained that the previous version had delay issues in operation when used abroad, but 'Clippick 2.0' achieves a 7 to 10 times faster speed compared to the previous version. Now Clippick is available abroad in real time.

Of course there have been similar kinds of services, so what is the advantage Clippick has over other similar services? "Clippick supports iOS, Android OS and can be used in Windows and MAC too, which means it can be used across 4 different platforms," Ahn, Jeeyun, the CEO of SENTENCE CO., Ltd said. "Also, with Clippick users can keep using the shortcut keys they are familiar with and not only the transmission from PC to mobile devices, it is also possible to transmit content from mobile devices to PC."
