

EAST PROVIDENCE, RI, September 19, 2013 **/24-7PressRelease/** -- For over 30 years, home security company executive

[Christopher Morra](#)

has been keeping track of the most recent technological developments in the home security industry. This has proven to be a full-time job, as rapid advancements in online and mobile technology of late have been crossing over into every other sector, including home security.

The most recent advancements in this technological crossover are covered in a recent news [article](#)

by Digital Trends, including one such smart home security system that has not only been developed, but also produced and will soon be ready to be shipped out to consumers.

This smart phone integrated security device looks much like any other small home security camera. It comes equipped with motion activated sensors, and it can record video as well as stream live footage.

What sets this particular device apart, however, is its ability to be modified and controlled via an app that is installed on the homeowner's smart phone. Through it, homeowners can check in on the security of their home from their phone anywhere there is an Internet connection. They can also program different alerts for the device, such as when the homeowner is at home, when they are away, and when they are asleep.

"This represents an inevitable but, nevertheless, impressive milestone in home security," explains Christopher Morra, home security company founder and owner. Devices such as this are giving homeowners security options that they never had before, allowing an unheard of level of home monitoring and threat detection. These types of system are also often much more convenient for homeowners constantly on the go, because they can know about a security breach immediately and take action then and there rather than having to wait until they get home to discover the breach."

According to the article, although the technology behind this particular home security device is solid and production has been issued, it is still being withheld from consumers in order for the developers to make a few more adjustments. Tweaks like multi-room functionality for multiple cameras and an increase in video quality for better facial feature recognition are still being made.

Christopher Morra Reports On Cyber Home Security

Written by Australian Business

When this and other products like it do finally hit the market, Christopher Morra is excited about the impact that they will have on homeowners' peace of mind.

ABOUT:

Chief Executive Officer Christopher Morra is the founder and leader of National Security and Fire Alarm Systems in East Providence, RI, a business he started as a teenager. For over 30 years since, Morra and his company have been intensely focused on customer service and satisfaction above all else. They have even gone so far as to intentionally lose money in order to better accommodate the needs of their customers. The company also keeps up with all of the advancements in technology in their industry, and all of their security systems are made in the United States. Morra himself also serves his community through his work with the local government, including helping to save citizens \$4 million in unnecessary tax increases.
