

Novi Dentist Offers Dental Veneers For Transforming Crooked Smiles

Written by Australian Business

NOVI, MI, September 26, 2013 **/24-7PressRelease/** -- From avid coffee drinking to motor vehicle accidents, these everyday situations can cause teeth to become discolored or malformed, which not only affects the health of your mouth but also your confidence. When you're suffering from stained, crooked or chipped teeth, it's hard not to be self-conscious about your smile. Whether you've have gapped teeth since childhood or years of smoking have yellowed your smile, Dr. Blavin, dentist in Novi, understands the importance of having straight, healthy teeth and can give you the smile you've been dreaming about. Through the use of dental veneers- an easier and longer-lasting alternative to dental crowns -Novi dentist, Dr. Blavin, can give you the smile you've always wanted.

"Dental veneers are a great alternative for straightening a patient's teeth without extra expense or long, painful procedures," says Dr. Neil Blavin, Novi dentist.

Dental veneers are thin composite resin or plastic shells that are affixed to the front of the tooth with cement, providing a straight, natural smile. For those with crooked, chipped or uneven tooth surfaces, veneers hide these imperfections. Furthermore, veneers are resistant to stains from coffee, wine and cigarettes. Since cement is used to bind the veneers, little to no anesthesia is required for this procedure, which is a welcomed option for those with dental anxiety.

"Having known many individuals who have a fear of the dentist, I know how to work with each patient to ease their concerns and provide a dental treatment that works best for them," says Novi dentist, Dr. Blavin. "If you're looking for a straighter or whiter smile, dental veneers are safe and non-invasive. Patients have been happy with the simple procedure and even happier with the results."

Getting dental veneers in Novi typically require three appointments, which includes diagnosis and treatment, preparation, and then bonding. During the tooth preparation visit, teeth are buffed to allow for the added thickness of the veneers. Also, a mold is taken during that visit and then sent to a laboratory where the veneers are fabricated. This visit takes approximately one to two hours. Since the teeth are buffed, this procedure is usually irreversible.

During the bonding visit, dental veneers are first placed on the tooth's surface with water or glycerin to allow for adjustments and color matching. When the proper tooth color has been achieved, a specific cleanser is placed on the tooth to create the proper bond. Once the specialized cement is in between the veneer and the tooth, a light beam hardens the cement.

"The bonding procedure is fast and painless," says Dr. Blavin, Novi dentist. "And what makes dental veneers so great is that patients can treat them just as they would regular teeth. Everyone should brush their teeth twice a day and floss at least once a day, and those with dental veneers should follow the same regime."

To know whether dental veneers are right for you, request an office consultation with Novi dentist, Dr. Neil Blavin, at <http://www.briarpointedentistry.com/> or by contacting his office at (248) 347-0030.
