

The Tint Guy Addresses the Top Myths of Jasper Window Tinting

Written by Australian Business

ATLANTA, GA, September 26, 2013 /24-7PressRelease/ -- The [Jasper tinting company](#) The Tint Guy would like to discuss a few myths about window tinting. Many people are unaware of how it works or the numerous benefits tint provides once installed. As a result of this general lack of understanding, quite a few inaccuracies have surfaced, which are what the [Jasper window tinting](#) company wants to address.

One point of concern that has surfaced is that windows' seal will be compromised, resulting in lower efficiency. The Tint Guy points out that this is simply not true because window seals are in no way affected by the application of tint.

Tint is Safe and Effective Another myth the firm has debunked is the belief that tint also causes windows to crack and prematurely deteriorate. Again, they note that these issues are rarely caused by the film, but are rather present before the material is even installed.

Chris Robinson, Owner of the Tint Guy, says "I personally think it is important to address these misconceptions, as they have prevented numerous households and businesses from realizing the advantages tinted windows have over non-tinted." The Jasper window tinting company also notes that contrary to popular belief, tinted windows do not harm plants. They still let in enough sunlight to prevent wilting, and can actually save many types of foliage from excessive UV ray exposure.

If you are searching for [commercial window tinting in Jasper](#) , consider giving the pros at The Tint Guy a call. To learn more about the services they offer, please visit <http://www.thetintguy.com>
