

Hughes Environmental Launches New Website

Written by Australian Business

LOUISVILLE, KY, November 20, 2014 **/24-7PressRelease/** -- Hughes Environmental is pleased to announce the launch of its new full featured website <http://www.hughesenv.com> along with new branding elements. The new website features enhanced content and information about the company's services and qualifications, and was designed to enhance the user's experience. The site was developed in partnership with Via Studio, a Louisville based web design company.

Hughes Environmental's website was designed to help managers for plants, factories, warehouses, and other industrial buildings make informed decisions about cleaning their facilities. It also helps the managers for commercial buildings learn about the benefits of cleaning their air systems, and the best ways for it to get done.

The website focuses on combustible dust remediation, rafter and ceiling cleaning, and duct cleaning. It also provides information about dry ice blasting, a new service Hughes Environmental added recently. The information was designed to be presented in an easy to read and understand format, while still providing enough data to be useful in making a decision.

"We listened to feedback from our customers and redesigned the site's content to better fit what they need to find when they visit. Often our customers don't realize the severity of their issue until after they contact us, and we realized education should be the goal of the site" said Michael Entwistle, Marketing Manager at Hughes Environmental.

Since 1980, combustible dust explosions in the United States have caused the deaths of 119 workers, injured 718, and created millions of dollars in damages, and Hughes Environmental works to remove the cause of these dust explosions.

About Hughes Environmental
