

CHULAVISTA , California, September 23, 2013 /PRNewswire/ --

Two of the world's best known alternative cancer treatment specialists have joined together to offer a combination of their treatments in an exciting new move.

Drs. Donato Perez and Ariel Perez are well respected in their own fields of integrative cancer treatment; IPTLD and Functional Oncology respectively. Until now each physician has worked independently of the other, leading their own team of cancer specialists with remarkable results. However, in this exciting new development, the two physicians have joined forces, to create a cancer treatment program with the potential to achieve even higher success rates.

Functional Oncology is a unique 5 step program that helps to repair a patient's health on a cellular level, optimizing cellular health and boosting the immune system before using natural therapies which weaken and destroy cancer cells. Lead by Dr. Ariel Perez, the long term survival rate for Functional Oncology is at least double that of conventional therapy for all types of cancer. The long term survival rate for Functional Oncology patients with lung cancer is 29% compared to 3% for conventional treatment.

Whilst cancer is caused by a wide range of independent events, Westernized lifestyles undoubtedly contribute to the increase in chronic disease. Aimed at eliminating the potentially harmful toxicity levels within the cells that make it possible for cancer cells to rapidly grow and weaken the immune system, the 5 step program not only helps patients to beat cancer, but helps them to remain in remission.

IPTLD, or Insulin Potentiated Targeted Low Dose Chemotherapy is a program that has been developed over the last 80 years, by Dr. Donato Perez, his father and grandfather before him. There are currently 451 IPTLD certified practitioners worldwide, all of whom have been trained and certified by Dr. Donato Perez

himself. Whilst IPTLD is conducted all over the world, Dr.

Donato Perez

is currently the only certified IPTLD practitioner in Mexico

.

The treatment uses insulin and natural medicine to help chemotherapy to target only cancerous cells, whilst magnifying the effect of chemotherapy. Coupled with chemo sensitivity tests to determine the types of drug that each individual's cancer will react to, IPTLD enables patients to experience the undeniable benefits of chemotherapy without poisoning or damaging healthy cells. This practice dramatically reduces the side effects and potentially fatal consequences of chemotherapy, whilst harnessing the cancer killing power of the drug.

Based at Hospital Angeles Tijuana, and part of Angeles Health, Mexico's largest network of private hospitals, Drs.

Donato Perez

and

Ariel Perez

will offer patients Functional Oncology, IPTLD or a combination of the two, after assessing each individual patient for their physical condition and stage and type of cancer.

Both treatment programs include [detoxification](#) , [nutrition](#) and [immune support](#) phases but by combining their cancer fighting skills Drs.

Ariel Perez

and

Donato Perez

believe that they will see even more spectacular results.

It is beyond doubt that the partnership of these two pioneers of cancer treatment will give patients every chance of survival. This unique collaborative approach could even change the face of cancer treatment in the future, helping the world to beat cancer.
