(PRLEAP.COM) Los Angeles, CA - Inventory management for Woocommerce sites has just become a lot easier. The new company, Scanventory, has created mobile inventory management software to be used with a Smartphone or other mobile QR scanning device. The new, convenient plug-in prevents the time consuming headaches that most store owners experience when dealing with Woocommerce website inventory.

Simple to use, Scanventory lets you update and manage your Woocommerce website inventory from anywhere you are. You can free yourself from your computer, go mobile and add instant updates to your e-commerce store-front.The magic happens with QR codes that are easily printed on standard office labels. These labels show important product information that can be attached to any warehouse shelf, bin or product label. Once scanned, a QR-code ready device will prompt for credentials to access the mobile inventory management software.

The mobile software gives you a plethora of options for your online store's stock control and product availability. This mobile interface manages stock quantities for products of different sizes, colors or qualities.

Detailed logs of changes in site-wide inventory related information offers a greater measure of security.

Scanventory tech support provides quick responses to questions and recommendations as well as free label support for unlisted label brands.

A missing piece of my online e-store. ~ R. Moore
